- Odoo Configuration
- Create your first module
- Database Models
- Menus and Actions

History of Odoo

- Started 2005 by Fabien Pinckaers
- Firstly named as tinyERP => OpenERP => Odoo

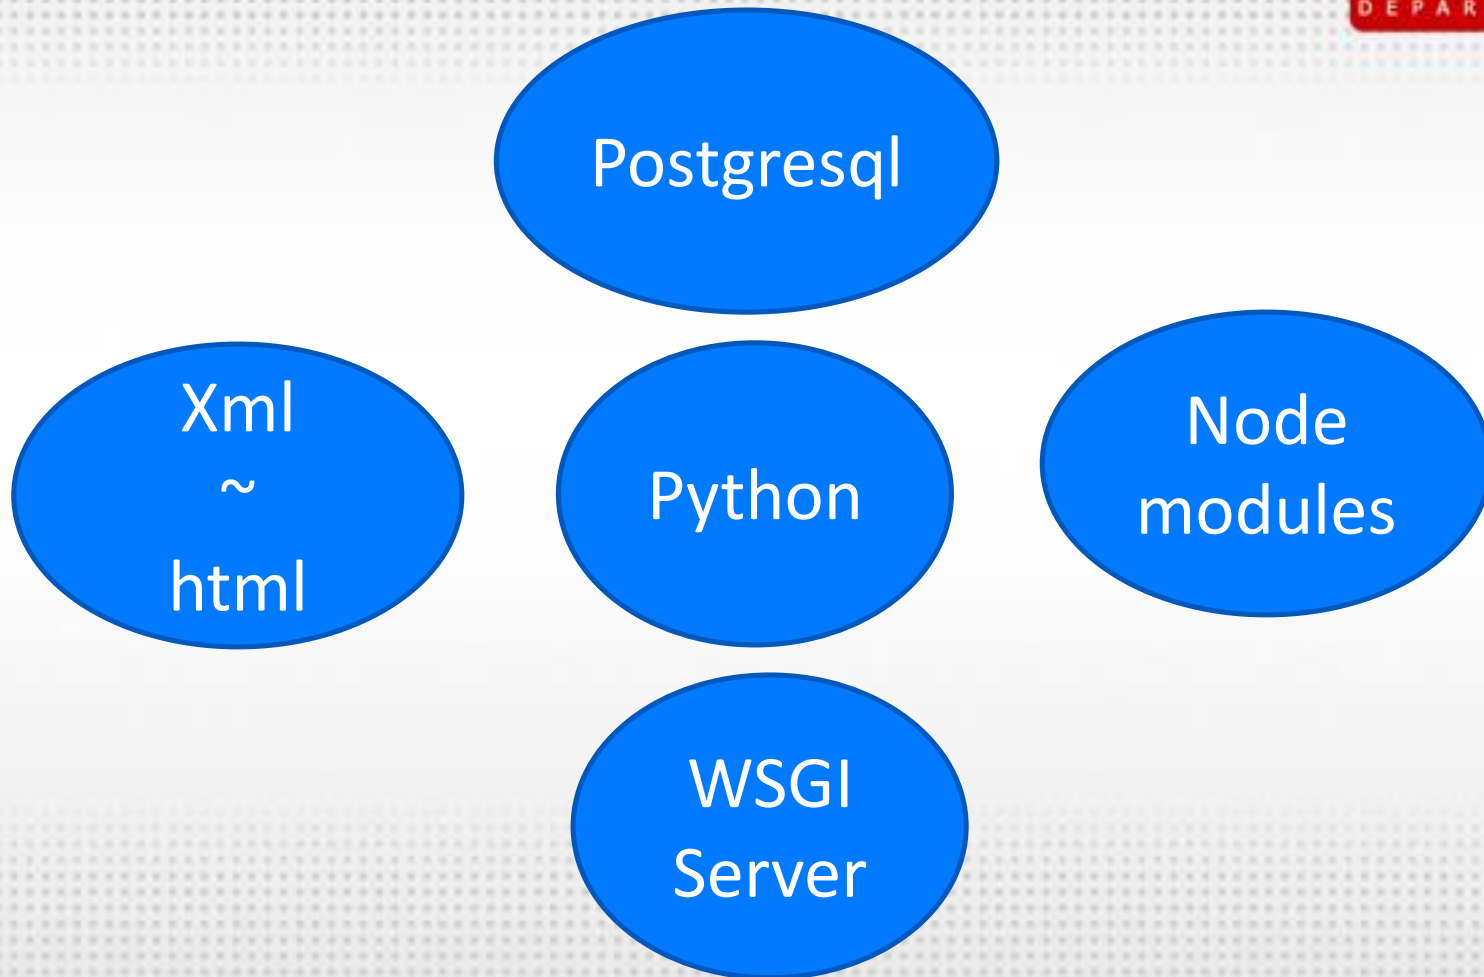

Why odoo?

- **Odoo** is business management software including CRM, e-commerce, billing, accounting, manufacturing, warehouse, project management, and inventory management.
- Odoo Can fit perfectly for SMEs
- Easy to extend
- Open Source ;)

• Odoo Eco-System

Odoo Configurations

OPEN SOURCE

```
[options]
addons_path = C:\Users\ab.hamdy\code\erp\odoo12\odoo\addons
admin_passwd = admin
db_host = localhost
db_port = 5432
db_user = ab.hamdy
db_password = iti
db_name = False
dbfilter = odoo12*
http_port = 8069|
```

Odoo Configurations

addons_path: The paths that Odoo will search for addons and load them
Tip: Don't add your addons with base addons, instead use extra custom addons path

admin_passwd: Master password to use from UI to manage your odoo dbs

db_host: Postgresql host (i.e. localhost)

db_port: Postgresql port (i.e. 5432)

db_user: Postgresql user (preferred to be a super user with the same name as os user)

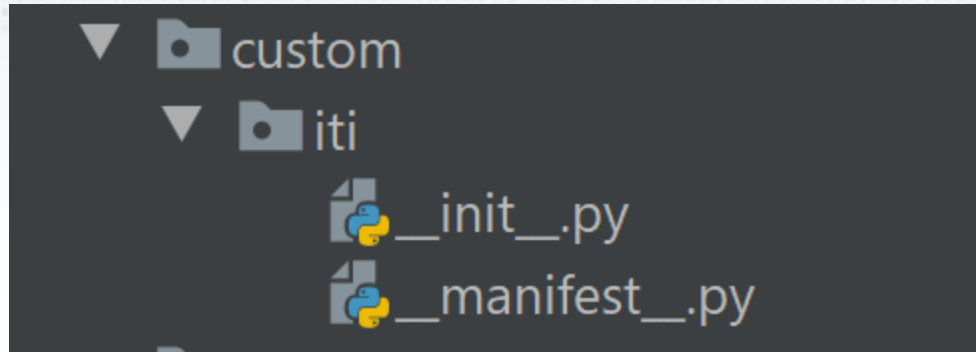

db_password: Postgresql user password (if False, odoo will use peer auth)

db_name: if you need to specify an exact db

dbfilter: regex for listing dbs (may be used for subdomains too)
http

http_port: The http port which the server will listen to.

Create your first module

- **`__init__.py`**: is for dealing with python imports
- **`__manifest.py`**: is for defining base info/dependencies for your module

Create your first module

__manifest__.py

```
{
    'name': "ITI module",
    'summary': "Short summary about the module",
    'description': """
        Long description of module's purpose
    """,
    'author': "My Company",
    'website': "http://www.yourcompany.com",

    # Categories can be used to filter modules in modules listing
    # Check https://github.com/odoo/odoo/blob/11.0/odoo/addons/base/module/module\_data.xml
    # for the full list
    'category': 'Uncategorized',
    'version': '0.1',
    'depends': ['hr'],
    'data': [
        # 'security/ir.model.access.csv',
        # 'views/registration_form.xml',
    ],
}
```

Create your first module

- ❖ Don't forget to:
 - ❖ Add custom path to your addons_path configuration
 - ❖ Restart odoo server
 - ❖ Update module list

Database Models

- ❖ import your model file in the models `__init__.py`
- ❖ Import models in your module `__init__.py`

Database Models

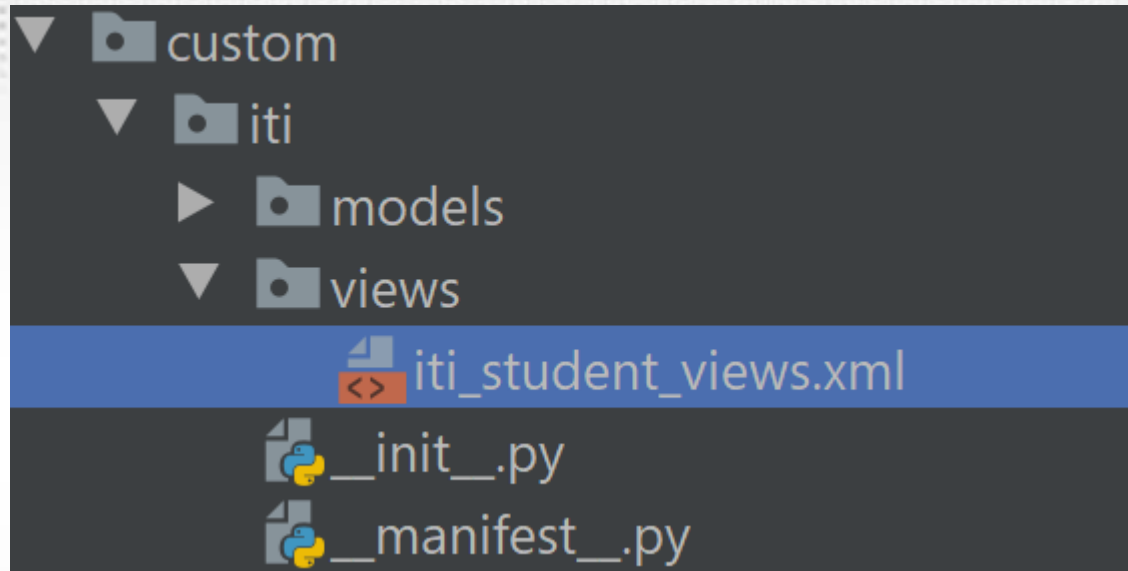

OPEN SOURCE
DEPARTMENT

```
from odoo import models, fields

class ItiStudent(models.Model):
    _name = "iti.student"

    name = fields.Char(required=True)
    age = fields.Integer()
    salary = fields.Float()
    info = fields.Text()
    gender = fields.Selection([('Male', 'm'), ("Female", "f")],
                             default="m")
    is_accepted = fields.Boolean()
    birth_date = fields.Date()
    cv = fields.Html()
    interview_time = fields.Datetime()
```

Menus and Actions

❖ Add views file path into `__manifest__.py` (data field)

Menus and Actions

OPEN SOURCE
DEPARTMENT

```
<odoo>
  <data>
    <record id="action_students" model="ir.actions.act_window">
      <field name="name">Students</field>
      <field name="res_model">iti.student</field>
      <!--      <field name="view_type">form</field>-->
      <!--      <field name="view_mode">tree,form</field>-->
    </record>

    <menuitem id="iti_root_menu" name="ITI"/>
    <menuitem id="iti_data_menu" name="Data"
      parent="iti_root_menu"/>
    <menuitem id="iti_students_menu" name="Students"
      parent="iti_data_menu"
      action="action_students"/>
  </data>
</odoo>
```
