

Ruby on Rails: Lab Day 3

Lab 3A: Resources, Validations, and Migrations

For this section, you will be working with the `new_rails` repository.

- **Branching:** I've created a new branch in my `new_rails` repo with the boilerplate views code. You'll need to sync your forked repo with this new branch, solve the lab, then open a PR on the same branch you just synced.
 - **Post Resource:** Create the seven CRUD operations for a `Post` resource just as we did in the lecture.
 - Attributes: `title:string, content:string`
 - Add string comments above the action, mentioning the endpoint URL for each action.
 - **User Resource:** In the same branch, create a new resource named `User` with the following attributes: `name`, `DOB`, `email`, and `phone_number`. Add the following validations:
 - Validate the **presence** of all fields.
 - Validate **email structure** on the email field (*Hint: You will need to search for how to do this!*).
 - Validate **email uniqueness** at both the model and database levels.
 - **Adding Columns:** Still in the same branch, generate a migration to create a new column on the `User` table called `address`. Research how to ensure the address column is set to `NOT NULL`.
 - **Reading Assignment:** Read this article on [Basic Validations from The Odin Project](#). Summarize your learnings in your Pull Request (PR) description.
 - **Syncing Views:** I will provide the necessary views in a new views branch on my `new_rails` repo. Make sure to sync your forked repo with mine to get this new branch.
 - **PR Title Format:** Your PR title must follow this exact format:
`<your_name>/lab_three_a`
-

Lab 3B: The Migration War! ✂️

Get ready for a collaborative (and competitive) migration exercise using the `migration_war` repository.

Part 1: The Setup

- Clone the [Migration War Repository](#).
- Create a migration that adds a new column to the single existing model (name the column after yourself).
- **Important:** Always `git pull` before you push! If someone pushed before you, remember to run `rails db:migrate` before pushing your own commit.
- Make sure you commit the `schema.rb` changes.
- **Deadline:** This must be completed by **7:00 PM** on the day of the lecture.
- **Do not open a pull request** on the repo! Just clone it locally and push directly to the `main` branch

Part 2: The War

- **The Game:** Your goal is to try to rename the columns created by your colleagues in Part 1.
- **Timeline:** The game starts after 7:00 PM on lecture day and ends right before the next lecture begins.
- **The Rules:** Each column rename must be in a **separate migration** and a **separate commit**. DO NOT bundle multiple changes into a single migration file!

Bonus Challenges (Read this part first!)

- **Authentication & Authorization:** Watch this [YouTube tutorial](#) and implement it in your app.
- **Rails Credentials:** Read through [The Complete Guide to Ruby on Rails Encrypted Credentials](#) and implement them.
- **Rails Concerns:** Read this article on [Concerns in Rails](#) and summarize it in your PR description.

- In the following picture, why do you think the migrations are grouped by the years (not mentioned in the lecture, very nice to know)?

○

General Notes & Reminders

- Make sure your commits are logically separated (create a separate commit for distinct changes).
- Always write a clear, detailed description for your Pull Requests.
