

Ruby on Rails: Lab Day 4

Lab 4A: new_rails (MVC)

For this section, you will be working with your existing `new_rails` repository.

- **Branching:** Create a new branch from `main` and name it `lab_four_mvc`.
- **Scaffolding:** Create the application using scaffolding to set up a One-to-Many relationship (User 1:M Post).
- **Associations (One-to-Many):** Create a `creator` association in the User model that links to the Post model (Creator 1:M Post).
- **Associations (Many-to-Many):** Create a new Many-to-Many association (`post` `M:M` `editor`) by manually creating the join table yourself. **Do not** use `has_and_belongs_to_many`.
- **Seeding:** Create seed data for Users and Editors in your `seeds.rb` file.
- **Reading Assignment:** Read this article on [Active Record Associations](#). *Note: Keep in mind that it contains some advanced concepts, so focus only on what you need for this lab.* Summarize your learnings in your Pull Request (PR) description.
- **Submission:** Push the changes to your remote repository and open a PR against my repository.
- **Note:** don't submit this lab before adding the link for the lab 4B repository (check the description below).

Lab 4B: API Mode

For this section, you will be creating a brand new repository from scratch.

- **Setup:** Create a new repository named `lab_four_api` in your account using Rails API mode (`rails new lab_four_api --api`).
- **Scaffolding:** Replicate the base setup from Lab 4A by creating the app using scaffolding with a One-to-Many relationship (User 1:M Post).
- **API Testing:** Create API requests for all CRUD operations using Postman (or an alternative API client).
- **Exporting API Collection:** Export your workspace/collection from Postman as a JSON file. Create a new file named `api.txt` in the root directory of your Rails project and paste the exported JSON directly into it.
- **Submission:** Add the GitHub link to this new `lab_four_api` repository into the PR description of your `lab_four_mvc` Pull Request (from Lab 4A).

General Notes & Reminders

- Make sure your commits are logically separated (create a separate commit for each step).
- Always write a clear, detailed description for your Pull Requests.
